

## B COMPREHENSION STRATEGIES

Several specific comprehension strategies have been selected for practice in this book. They are stated after the questions, so students become familiar and learn to recognise the strategies needed for different question types.

<b>Using prior knowledge</b>	Students comprehend a text by linking their prior knowledge (for example own experiences or familiar concepts) and the new information given in the text. Students may make connections between the text and themselves, the text and other texts previously read, and the text and the world.
<b>Using contextual clues</b>	Students comprehend a text or understand a difficult word in the text by searching for clues such as visual cues, titles, subheadings, familiar vocabulary and typographical and visual features found in the context.
<b>Making predictions</b>	Predictions involve the students using illustrations, a text or background knowledge to help them construct meaning. Students might predict what the text could be about, what could happen or how characters could act or react. Predictions may occur before, during and after reading, and can be adjusted during reading.
<b>Sequencing details</b>	The strategy of sequencing details requires students to recall information, order details and piece information together to make sense of the text. This helps students to continually monitor their understanding of the text.
<b>Making inferences</b>	This strategy requires higher-order thinking, training students to analyse the text read. Instead of lifting answers directly from the text, students need to think further and use their prior knowledge to comprehend the meaning of the text.
<b>Scanning for specific information</b>	The strategy of scanning for specific information requires students to quickly locate specific details such as dates, places or names, or those parts of the text which support a particular point of view. It is sometimes used in conjunction with other strategies.
<b>Distinguishing between cause and effect</b>	The strategy of distinguishing between cause and effect requires students to fully understand the causal relationship between two events. This enables students to get a clearer picture of what the text or story is about.
<b>Comparing and contrasting</b>	Students make comparisons by thinking more specifically about the similarities and differences between two ideas, topics, texts or concepts.
<b>Categorising and classifying given details</b>	The strategy of categorising and classifying given details trains students' ability to group things of the same type together. Before grouping these things, students need to analyse them and in the process, they learn the similarities and differences between these things.
<b>Identifying the purpose and audience of text read or viewed</b>	After reading a text, students determine who the targeted audience is and why the text is written. This enables them to understand the text better.
<b>Analysing organisational patterns in a text</b>	This strategy involves the students interpreting the organisational patterns in a text such as the sequence of ideas or events, comparison-contrast, cause-effect and problem-solution relationships.
<b>Drawing conclusions</b>	The strategy of drawing conclusions requires students to completely understand what the whole text is about and all the relationships in the text before they can make a correct judgment. This may involve their background knowledge and own experiences.
<b>Interpreting and integrating information from a variety of sources</b>	Students obtain information from different sources such as different people's opinions, atlases or their own observations to analyse an event that has happened and to deduce a logical reason for the occurrence of the event. This enables students to analyse the different sources and understand how the different information can be linked in order to understand the bigger picture.
<b>Identifying problem-solution in a text</b>	By linking an issue to its problem source, students identify the problem-solution relationship in a text. This enables students to analyse the problem in the text by making connections between the context and their background knowledge of the text.
